

Bhavatah Public School

Issues and Errors Found in the Application

Document Type: Application Testing / QA Issue Report

Total Issues Identified: 10

1. Session / Login State Handling

- After logging into the application, if the user accesses the login page again within the same browser window/session, the application displays the login screen and asks the user to log in again.
- **Expected Behavior:** Once the user has successfully logged in, the existing session/login state should be maintained. Accessing the login page again within the same session should redirect the user to the Home/Dashboard page instead of displaying the login form.
- **Note:** This behavior may differ when the user starts a new browser session/window where authentication has not been maintained.

2. Field Validation

- Validation is currently being performed mainly after the user clicks Submit. For example, entering ABCDE in a phone number field results in an invalid phone number error only after submission.
- **Expected Behavior:** Appropriate input restrictions should be applied directly to the respective fields so that invalid characters or formats cannot be entered where they are not permitted.
- **Examples:** Phone number fields should allow appropriate numeric input and length; email fields should follow a valid email format; number fields should restrict non-numeric characters where applicable.
- **Requirement:** Both input-level validation and submit-level validation should be implemented where required.

3. Admin Staff Messaging Access

- Current messaging permissions allow Admin users to message Teachers and Students, while Teachers can message Staff. However, the Admin does not appear to have the option/access to message Staff.
- **Expected Behavior:** Admin users should have messaging access to all relevant user groups, including Staff, in addition to Teachers and Students.
- **Requirement:** Verify and update the messaging permission matrix so that Admin users can message Staff.

4. Parent Consent Request Module Error

- **Module:** Parent Consent Request
- An error is occurring within the Parent Consent Request module.
- **Expected Behavior:** The Parent Consent Request module should load and function correctly without errors.
- **Requirement:** The module and its related functionality should be checked thoroughly to identify and resolve the issue.

5. Teacher Access to Parent Information

- When a Teacher logs in using their Teacher ID, they are currently able to view the information/IDs of all parents in the system.
- **Expected Behavior:** Teachers should have restricted access based on their assigned class/classes. For example, if a teacher is assigned to Class 5, the teacher should only be able to view parent information associated with students belonging to Class 5.
- **Requirement:** Parent visibility/access should be controlled based on the teacher's assigned class and student association. Teachers should not have access to unrelated parent information unless explicitly authorized.

6. Parent Engagement - Recent Messages Display

- **Module:** Insights and Reports -> Parent Engagement; **Section:** Recent Messages
- The Recent Messages section currently displays all available messages in a single view/tab. As the number of messages increases, the section becomes very large and negatively affects the UI layout and overall user experience.
- **Expected Behavior:** Display a limited number of recent messages initially, such as 10-15 messages.
- **Suggested Solution:** Provide a Show More option or implement pagination/Next Page functionality.
- **Requirement:** The message list should be controlled so that a large number of records does not negatively impact the UI or user experience.

7. Visitor Registration - Old Records Not Available

- **Module:** Visitor Registration
- Previously created visitor records are not available after a certain period. Older records appear to be automatically removed from the database/system.
- **Impact:** This creates a significant issue for security, verification, and emergency purposes, as historical visitor information may need to be reviewed at any time.
- **Expected Behavior:** Visitor registration records should be persisted and retrievable unless they are intentionally deleted according to a defined data-retention policy.
- **Requirement:** Investigate and correct the automatic deletion/removal of old visitor records. Historical visitor records should remain accessible to authorized users.

8. Search Functionality for Student and Teacher Dropdowns

- Several fields use dropdowns to select entities such as Students and Teachers. Currently, the dropdown displays all available records for selection.
- **Impact:** This may work when the number of records is small. However, if the application scales to 10,000+ students or a large number of teachers, finding a particular person through a traditional dropdown will become difficult and time-consuming.
- **Expected Behavior:** Dropdown fields containing a large number of records should provide integrated search functionality.
- **Requirement:** Users should be able to type and search for a specific student or teacher instead of manually scrolling through a potentially very large dropdown list. This should apply to both Student and Teacher selection fields and other high-volume dropdowns where appropriate.

9. Email and WhatsApp Notifications for Events

- When an event/action is performed in the application, there should be an appropriate notification mechanism to ensure proper communication with the relevant Teacher, Student, Parent, or other concerned user.
- **Expected Behavior:** Relevant events should trigger appropriate notifications through Email and/or WhatsApp, depending on the nature of the event and intended recipient.
- **Examples:** Events related to students, teachers, attendance, fees, communication, approvals, requests, or other important activities should be evaluated for notification requirements.
- **Requirement:** Verify/implement an event-based notification system so concerned users receive timely notifications and important actions are not missed.

10. Invoice Status - Paid/Unpaid Fee

- **Module:** View/Download Invoice
- The system currently allows an invoice PDF to be generated and downloaded for both Paid and Unpaid fees. However, the generated PDF does not clearly indicate whether the corresponding fee is Paid or Unpaid.
- **Expected Behavior:** The invoice should clearly display the payment status. For a paid fee, the invoice should indicate PAID. For an unpaid fee, it should indicate UNPAID/PENDING, or follow the defined business flow for unpaid invoices.
- **Requirement:** Review the complete invoice-generation flow to determine whether invoices should be generated for unpaid fees and, if so, ensure the PDF clearly identifies the payment status.
- **Note:** The exact expected behavior for generating/downloading an invoice for an unpaid fee should be confirmed against the application's defined business requirements.
